

---My delicious meat balls---

I will never forget a meal I had before 2-3 month ago. It was a beautiful weekend morning I .. woke up so happy and decided to cook something delectable and really quick for myself before I start studying for exams. I made juicy tender meatballs with Paratha. It was so delicious that the all flavors and spices were blooming in my mouth and the salty buttery paratha made it remarkable. So after eating the amount I needed, I stored it in the fridge so I can eat it .again in the afternoon or night

when I went again after a lot of hours of studying to eat my legendary meal but the surprise was it was vanished from the fridge I don't know who ate it but literally they Licked the whole plate, so I got so angry because it's not the first time they snatch my food but this time it was too good I didn't want to lose it but what surprised me more that the person who ate my yummy dish was my dad! I felt so guilty because I said really bad things before I know that he was my father, especially when my mom told that he liked it.

=====

Episode 10, Act One, final scene, first - of June (Day: Sunday) (2011).

Mr. Jackson is standing at his office scanning the (C. V.) and clicking the mouse to accept Kevin smith but he made a mistake again and accept Kevin Steve instead of Kevin smith and Kevin until now waiting a message from Mr. Jackson while doing a part time job.

All About Flamingos

Flamingo are a type of wading bird from Kingdom Animalia . Fossil evidence indicates that the group from which flamingos evolved is very old and existed about 30 million years ago, They usually live in .the shallows of salt or brackish water or alkaline lakes

After looking at relationships with waterfowl, it turned out that flamingos were parasitized by feather lice of the genus *Anticold*, which are otherwise found exclusively on ducks and geese, so they discovered in several studies that flamingos .are related to ducks, geese and grebes

The flamingo family consists of six species. including the greater flamingo, Chilean flamingo, lesser flamingo etc. they love to eat foods like shrimp, snails, and algae. Food contains a chemical called beta-carotene, which makes flamingos' feathers pink. When it's time to eat, a flamingo .will place its head upside down in the water with its bill pointed at its feet

:Flamingos can:

Flamingos can save more energy when standing on one leg than on two. Flamingos can sleep in this ❖
.position

they do not have mammary glands, but both male and female flamingos can produce a specific * ❖
."milk" from their upper digestive tract to feed their chicks

flamingos can walk on water Before taking off into the air, flamingos need to increase their * ❖
.speed.. so they take a short distance even when they are in the water

Contrary to what you might think, flamingo eggs look like chicken eggs: white on the outside and yellowish or reddish on the inside. However, in some cases, the yolk of flamingo eggs may have a pinkish tint.

Flamingos do not do well if there are not many other members around. A new study of captive birds finds that they are known to be a very social species

These animals are very social and they thrive on interaction with each other. Flamingos are the national .bird of the Bahamas
